

CONTACT PRODUCT, AND CATALYST COMPONENT AND CATALYST FOR
ADDITION POLYMERIZATION, AND PROCESS FOR PRODUCING ADDITION
POLYMER

5

Field of the Invention

The present invention relates to a contact product; a
catalyst component for addition polymerization comprising the
contact product; a catalyst for addition polymerization using
10 the catalyst component for addition polymerization; and a
process for producing an addition polymer.

Background of the Invention

Since olefin polymers such as polypropylene and
15 polyethylene are excellent in mechanical properties and
chemical resistance, and excellent in balance between those
properties and economical efficiency, they have been widely
used in various fields such as a packaging field. These olefin
polymers have conventionally been produced by polymerizing
20 an olefin using a conventional type solid catalyst (multi-site
catalyst), which combines a solid catalyst component obtained
by using a metal compound of the Group IV such as titanium
trichloride or titanium tetrachloride, with a metal compound
of the Group 13 represented by an organoaluminum compound.

25 However, as a catalyst providing addition polymers having
less stickiness and more excellent strength than those produced
by the conventional catalyst, a so-called single site catalyst
prepared by combining a catalyst component such as a metallocene
complex or half metallocene complex with a co-catalyst
30 component for activation such as an aluminoxane, and

tri(n-butyl)ammonium tetrakis(pentafluorophenyl)borate, was proposed and with respect to the single site catalyst, improvements for using it in an industrial scale have been studied (e.g. USP 4542199, USP 5621126 and USP 5153157).

5 Further, recently, a compound prepared by contacting diethylzinc, pentafluorophenol and water has been developed as a co-catalyst component for activation, and a catalyst prepared by contacting said co-catalyst component with the metallocene complex has been proposed as a high activity
10 catalyst (e.g. USP 6586356).

However, according to the inventor's studies, when an olefin is addition-polymerized with the above-mentioned catalyst, its polymerization activity is not completely satisfactory.

15 Summary of the Invention

Under the above-situations, an object of the present invention is to provide a contact product used as a catalyst component of a catalyst for addition polymerization having
20 an excellent polymerization activity; a catalyst component for addition polymerization comprising the contact product; a catalyst for addition polymerization using the catalyst component for addition polymerization; and a process for producing an addition polymer using the catalyst for addition
25 polymerization.

Namely, the present invention is a contact product obtained by a process comprising the step of contacting the following components (a) to (d):

(a) a compound represented by the following formula [1]

[1],

(b) a compound represented by the following formula [2]

[2],

(c) a compound represented by the following formula [3],

[3], and

(d) a nonionic surfactant having no active hydrogen, wherein M^1 is a metal atom of the Groups 3 to 12, the Group 14, the Group 15 or Lanthanide Series of the Periodic Table of the Elements; r is a valence of M^1 ; L^1 is a hydrogen atom, a halogen atom, a hydrocarbon group or a hydrocarbonoxy group, and when two or more L^1 's exist, they may be the same or different from one another; each of T^1 and T^2 is a non-metal atom of the Group 15 or 16 in the Periodic Table independently of each other; s is a valence of T^1 ; t is a valence of T^2 ; R^1 is an electron-withdrawing group or an electron-withdrawing group-containing group, and when two or more R^1 's exist, they may be the same or different from one another; and R^2 is a hydrocarbon group, and when two or more R^2 's exist, they may be the same or different from one another.

Also, the present invention is a catalyst component for addition polymerization comprising said contact product.

Further, the present invention is a catalyst for addition polymerization obtained by a process comprising the step of contacting said catalyst component for addition polymerization with a compound of a metal selected from the group consisting

of metals of the Groups 3 to 12 and Lanthanide Series of the Periodic Table, and optionally an organoaluminum compound.

Still further, the present invention is a process for producing an addition polymer comprising the step of
 5 polymerizing an addition polymerizable monomer in the presence of said catalyst for addition polymerization.

25 The catalyst for addition polymerization of the present
 invention can be applied to homopolymerization or
 copolymerization of these monomers. Examples of a combination
 of monomers constituting the copolymer are ethylene and
 propylene; ethylene and 1-butene; ethylene and 1-hexene; and
 30 propylene and 1-buten .

The catalyst for olefin polymerization according to the present invention is particularly preferable as a catalyst for olefin polymerization, and is preferably used for a process for producing an olefin polymer. The olefin polymer is particularly preferably copolymers of ethylene with an α -olefin. Among them, preferred is a copolymer of ethylene with an α -olefin having a polyethylene crystal structure. The α -olefin has preferably 3 to 8 carbon atoms, and examples thereof are propylene, 1-butene, 1-hexene and 1-octene.

A polymerization method is not particularly limited. For example, there can be exemplified a solvent polymerization method and a slurry polymerization method, in which an aliphatic hydrocarbon (e.g. butane, pentane, hexane, heptane and octane), an aromatic hydrocarbon (e.g. benzene and toluene) or a halogenated hydrocarbon (e.g. methylene dichloride) is used as a solvent; a bulk polymerization method, in which polymerization is carried out in a liquid monomer; a gas phase polymerization method, in which polymerization is carried out in a gaseous monomer; and a high-pressure polymerization method, in which polymerization is carried out in a supercritical liquid condition at a high temperature under a high pressure. As a polymerization type, either of a batch-wise type and a continuous type is possible. Further, polymerization may be carried out in two or more steps having different polymerization conditions from each other.

A method of feeding the respective components in a reactor is not particularly limited. Examples thereof are a method of feeding them in a solid condition; and a method of feeding them in a condition of a solution, a suspension or a slurry, using a hydrocarbon solvent, from which components

deactivating catalyst components such as moisture and oxygen are completely removed. Examples of the solvent are the above-mentioned aliphatic hydrocarbon (e.g. butane, pentane, hexane, heptane and octane), aromatic hydrocarbon (e.g. benzene and toluene) and halogenated hydrocarbon (e.g. methylene dichloride).

When using the contact product (A) and the compounds (B) and (C) in a solution, suspension or slurry, each of the contact product (A) and the compound (C) is used in a concentration of usually from 0.0001 to 100 mmol/liter, and preferably from 0.01 to 10 mmol/liter, in terms of the amount of metal atoms contained therein. A concentration of the component (B) is usually from 0.0001 to 100 mmol/liter, and preferably from 0.01 to 10 mmol/liter, in terms of the amount of a metal atom contained therein.

The polymerization temperature is usually from -100 to 350°C, preferably from -20 to 300°C, and more preferably from 20 to 300°C. The polymerization pressure is usually from 0.1 to 350 MPa, preferably from 0.1 to 300 MPa, and more preferably from 0.1 to 200 MPa. In general, the polymerization time can be appropriately determined according to the kind of a desired polymer and a reaction apparatus, and a range of from 1 minute to 20 hours can be adopted. In order to control a molecular weight of an addition polymer, a chain transfer agent such as hydrogen may be added.

Examples

The present invention is further illustrated in detail according to Examples and Comparative Examples below, but the present invention is not limited thereto.

The measurement values of respective items in Examples were measured according to methods described below.

(1) Content of α -olefin unit in polymer

5 The content of an α -olefin unit in an obtained polymer was determined from an IR absorption spectrum, wherein the measurement and calculation were carried out by using characteristic absorptions derived from the α -olefin, according to a method described in "Die Makromolekulare Chemie,
10 177, 449 (1976) McRae, M. A., Madams, W. F.". The result was shown as the number of a short chain branch per 1000 carbon atoms (short chain branch degree : SCB). The IR absorption spectrum was obtained by a measurement using an infrared spectrometer (FT-IR7300, manufactured by NIPPON BUNKO Inc.).

15 (2) Molecular weight and molecular weight distribution of polymer

They were determined under the under-mentioned conditions according to a gel permeation chromatography (GPC).
20 A calibration curve was prepared using standard polystyrenes. Molecular weight distribution was evaluated by a ratio, (Mw/Mn), of a weight average molecular weight (Mw) to a number average molecular weight (Mn):
